

## Abstract

A flat-panel display unit is provided which includes: a PDP; an aluminum chassis that is attached to the PDP; an upper data driver substrate and a signal processing substrate that are attached to the aluminum chassis; and a flexible cable that connects the substrates electrically. Between the substrates, a pressing plate fixes at least one part of the flexible cable, so that the space between the flexible cable and the aluminum chassis remains unchanged. Thereby, a stray capacitor can be stably formed using the insulating material of the flexible cable, and a high-frequency noise can be effectively reduced.
